

...the Pavement Deterioration Process with Dura-Fill® Hot Pour Crack Sealants

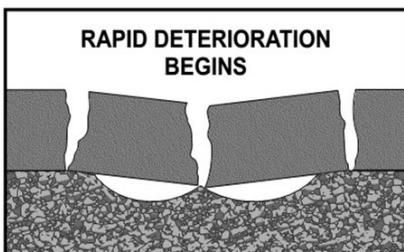

Pavement cracks are inevitable and part of the natural cycle of the paving process. Treating these cracks is necessary to protect and preserve the pavement. Crack sealing eliminates the need for costly repairs or repaving and significantly extends the service life of the roadway, driveway or parking lot.

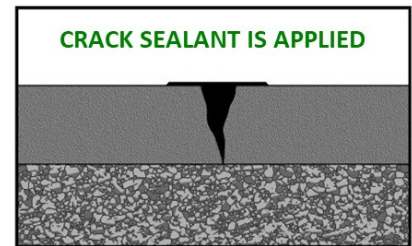

If crack sealant is NOT applied, water penetrates the crack. This softens and washes away the pavement base.

Vehicles compress the pavement down-ward causing stress points to develop as the pavement's support system is eroded.

Pavement deterioration continues, causing alligator cracking and potholes.

Crack sealant is applied and the deterioration is STOPPED, the sub-base is protected and the service life of the pavement is extended.

Dura-Fill Hot Applied Crack Sealants are available in a variety of formulas to meet specific project requirements. Please contact us directly to discuss what product will fit your needs.
